

Study roadmap

English objectives: October 14, 2026 · Reviewed September 27, 2026

Microsoft Certified: Agentic AI Business Solutions Architect Expert

These resources target the English AB-100 objectives effective October 14, 2026. This is an incoming version at the September 27, 2026 source review. If you test before October 14, use the objectives that apply on your exam date. Localized exams can update later; confirm your language and exam date with Microsoft.

Start with scope, then build evidence

Work at your own pace. This roadmap is not a complete course, a fixed study schedule, or a readiness score. Use the complete official guide to check every objective.

Plan AI-powered business solutions (25-30%)

Design AI-powered business solutions (25-30%)

Deploy AI-powered business solutions (40-45%)

Summary and detailed domain weights agree in the source check. Weight ranges are not guaranteed question counts.

Your study loop

Explain the decision → practice a bounded scenario → refresh current sources → record evidence → review remaining gaps.

Original WebLizard Labs study aids; not an official Microsoft checklist, not endorsed by Microsoft, and not a predictor of your exam score. No exam dumps or copied exam questions.

Study roadmap / next actions

English objectives: October 14, 2026 · Reviewed September 27, 2026

Confirm your version and starting point

Record your intended exam date and language. Read the official audience profile and current credential requirements. Compare the effective-date heading with your appointment. Use the checklist to distinguish what you can explain, what needs practice, and what needs a documentation refresh.

Leave with: Exam date and language; selected objective version; first checklist pass.

Plan around a business outcome

Choose a small scenario, such as routing a service request to the right team. Define success, data boundaries, and a non-AI baseline before selecting a platform. Compare building, buying, and extending. State ROI assumptions rather than promising savings.

Leave with: A requirement, measurable acceptance criteria, constraints, and a short option comparison.

Design a bounded solution

Identify the agent role, grounding sources, allowed actions, caller identity, and approval points. Compare candidate platform capabilities against the same requirement. Trace one happy path and one denied or failed action. Record facts that still require current product documentation or a lab.

Leave with: A simple architecture sketch and a decision record with a credible alternative.

Study roadmap / next actions

English objectives: October 14, 2026 · Reviewed September 27, 2026

Make deployment and operation testable

Define quality and safety test cases, telemetry, ownership, release gates, and rollback. Review least privilege, data residency, auditability, and prompt-manipulation risks. Practice with non-sensitive data in an authorized sandbox; check access and cost before provisioning.

Leave with: A test matrix, monitoring plan, and change/rollback note.

Return to evidence, then repeat

Work through the official learning path to address the gaps you found. Revisit the complete objective bullets in the study guide, not only the ten grouped areas here. Update Explain, Practice, and Refresh separately. Reopen decisions when product documentation, constraints, or the objective version changes.

Leave with: Evidence links, an honest remaining-gap list, and a next-review date.

Official resources

1. Official AB-100 study guide

Exam scope, domain weights, effective date, and change log.

2. Official certification requirements

Credential requirements, prerequisites, exam scheduling, and availability. Passing an exam and earning a credential are distinct; check all requirements here.

3. Architect AI solutions for business productivity

Microsoft Learn advanced learning path. Use alongside the target guide; one path does not guarantee complete objective coverage.
